

Preparing for Traffic Incidents in U District

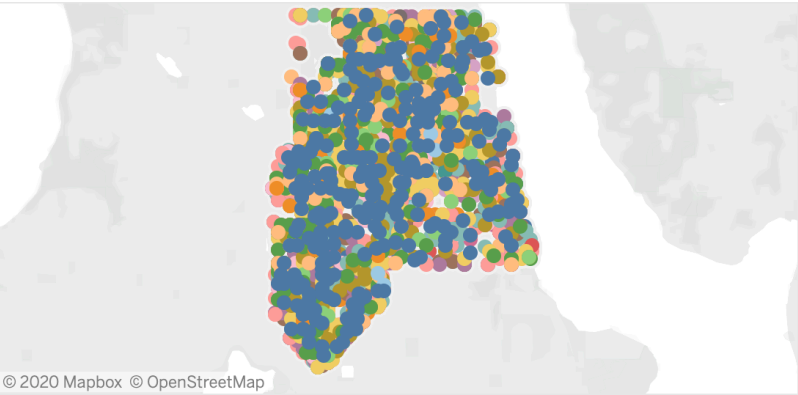

USER GROUP: This dashboard is designed to be used by the members of the Seattle Police Department who are stationed in U District. These officers must be prepared for several kinds of traffic incidents at all times, but perhaps they should be more prepared for some kinds of incidents than for others.

SCENARIO: A police officer is stationed in U District. He/she wants to know exactly which kinds of traffic incidents he/she is most likely to encounter based on his/her circumstances.

RESEARCH QUESTION: This dashboard explores how police officers in U District can weigh different factors (location, day of the week, and day of the month) to be prepared for certain types of traffic incidents.

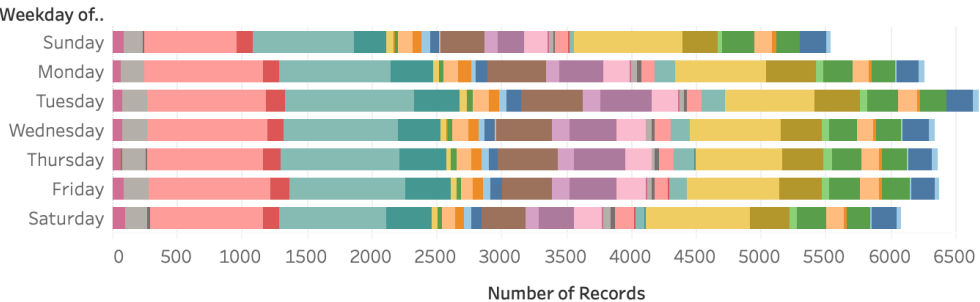

FUTURE WORK: Some limitations/biases of this dashboard are that all visualizations are limited to the year 2017. It is not necessary that the same trends apply in other years, so this could potentially mislead viewers. Similarly, it is not necessary that the same trends apply in all months, so even though burglaries are more common around the 25th of February, they may not be more common around the 25th of March. A future visualization may attempt to represent these trends more clearly so that inappropriate conclusions are less easily reached.

Types of traffic incidents in U District by location

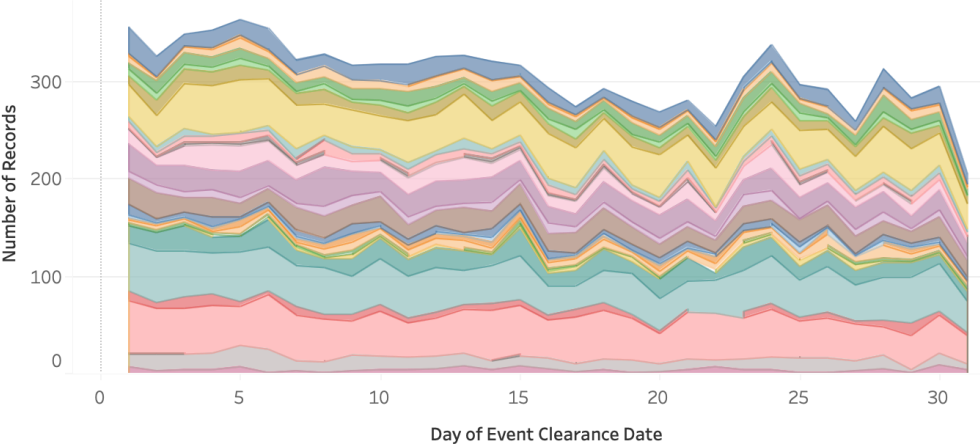

This map visualization explores any possible correlation between location and type of traffic incident. Police officers can use this map to be more prepared for certain types of incidents based on where they are stationed within U District. For example, a police officer may see that in his/her area, animal complains are more common than auto thefts. He/she could then use this information to be extra prepared to combat animal complaints.

Types of traffic incidents in U District by day of week

This stacked horizontal bar graph visualization explores any possible correlation between day of week and type of traffic incident. By using a stacked bar graph, we can visualize the frequency of each type of traffic incident. This way, a police officer can see which traffic incident types are most common on the relevant day of the week, and he/she can prepare accordingly for his/her day ahead.

Types of traffic incidents in U District by day of month

This area chart visualization explores any possible correlation between day of month and type of traffic incident. This visualization shows the trend of total traffic incidents on each day as the month progresses. A police officer can see, for example, that toward the end of the month, there are fewer traffic incidents. Furthermore, he/she can see a breakdown of traffic incident type and prepare for the day ahead.
